

ABSTRACT

[0060] A lint/pet hair roller assembly includes a body supporting a tubular adhesive lint remover roll. The assembly includes a handle and a roll support. The roller support includes a cross-member transversely mounted on the handle and carrying a pair of outwardly extending legs. Roll support members are fixed or rotatably carried on the legs for supporting a lint roll. The legs, in one aspect, are moveably mounted in the cross-member and biased to a normal first spacing to support a lint roll, but extendable outward for movement of the lint roll relative to the legs. In another aspect, a telescoping lint roll support is normally biased to an extended position to support the lint roll, but is collapsible for movement of the support relative to the legs. Alternately, a dispenser is carried on the handle for dispensing fluid from a storage chamber. Alternately, an additional cleaning element is carried on the support.
